DISPLAY SUPPORT COMPRISING A COATED FABRIC

Abstract of the Disclosure

A display support, designed to be printed, includes a coated fabric comprising a textile layer and two impregnation layers located on opposite surfaces of the textile layer. A coat of varnish, designed to be printed, is deposited on one of the impregnation layers. A pressure-sensitive adhesive layer capable of being repositioned, is deposited on the impregnation layer opposite the one receiving the coat of varnish. A protective layer arranged on the adhesive layer consists of a sheet with low adherence strength relative to the pressure-sensitive adhesive layer.
